Submission Date

Project Report Guidelines

A project report documents the completed work, explaining objectives, methods, and results. It should be well-structured, concise, and supported with evidence.

General Requirements

- Length: 2–3 pages
- Include visuals (Screenshots of codes, Input, Output)
- Use clear headings
- Maintain formal writing style
- Cite sources if used (i.e. code copied from sources)

1. Abstract

Summary of the project.

2. Introduction

Background and objectives.

3. Methodology / Implementation

Explain how the project was done.

4. Results / Output

Show outputs with visuals.

5. Challenges and Limitations

Describe issues faced.

6. Conclusion and Discussion

Summarize outcomes.

7. Future Work

Suggest improvements or mention incomplete parts.

8. References

List sources.

9. Individual Contributions

Describe each member's contribution in details

The Living Book

1. Abstract

The Living Book is an interactive digital storybook created as an ICP final project. The website presents stories in a book-style interface. Users can open the book, move through the pages, and choose between two story paths: A Memory and A Dream. Each path contains several stories and an ending page. The project uses HTML to create the structure, CSS to design the appearance, and JavaScript to control the interaction and navigation.

2. Introduction The purpose of The Living Book is to create a simple and creative way to read stories on a website. Instead of displaying stories as ordinary web pages, the project presents them as pages of a digital book. The main objective is to make reading more interactive by allowing the user to choose a story path and move between different pages.

2. Introduction

The purpose of The Living Book is to create a simple and creative way to read stories on a website. Instead of displaying stories as ordinary web pages, the project presents them as pages of a digital book. The main objective is to make reading more interactive. by allowing the user to choose a story path and move between different pages

3. Methodology / Implementation

HTML: The HTML file creates the structure and content of the project. It contains the cover, welcome page, choice page, memory stories, dream stories, ending pages, navigation buttons, and page numbers. The HTML file also connects the CSS and JavaScript files. CSS: The CSS file controls the visual design. It creates the book-like layout, backgrounds, colors, fonts, page shadows, buttons, spacing, and simple animations. The design uses a dark background around the book and light-colored pages. JavaScript: JavaScript controls the interactive parts of the project. The **open Book()** function opens the book. The **choose Path()** function sends the user to either the memory or dream path. The **go Next()** and **go Back()** functions control navigation, while **restart Book()** returns the user to the cover. The project also supports keyboard arrow keys for moving forward and backward.

4. Results / Output

The final output is an interactive digital book. When the user clicks the cover, the book opens to the welcome page. The user can then choose A Memory or A Dream. The memory path contains three stories, and the dream path contains three stories. Navigation buttons allow the user to move between available pages.

5. Challenges and Limitation

One challenge was managing several different story views and making sure that only the correct page was visible at a time. The JavaScript uses a current-view variable, a list of views, and a history stack to manage navigation. Another limitation is that the project is a front-end website, so it does not use a database or server-side system.

6. Conclusion and Discussion

The Living Book successfully creates an interactive story-reading experience using HTML, CSS, and JavaScript. The project combines website structure, visual design, and JavaScript functionality to create a digital book with multiple paths. It demonstrates how the three technologies can work together to build an interactive web project.

7. Future work

In the future, the project could be improved by adding more stories, images, page-turning animations, more interactive elements, and additional story choices. It could also include a system for saving a user's progress and allowing users to create or add their own stories.
